## Granite Composite Sinks - and why we *Love* them

### *About*

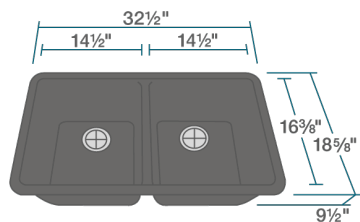

A Granite Composite sink is an engineered product manufactured using a mix of granite stone and acrylic resins. Granite composite sinks are formed under high pressure making them nonporous.

### *Advantages*

- **Durability:** Our quality composite sinks are resistant to heat up to 550 degrees, stains, scratches and chips.
- **Variety:** Unlike stainless steel or porcelain, granite composite sinks are available in six different colors including: black, white, mocha, beige, silver, and slate, making it the perfect customizable accent piece to compliment your countertop surfaces.
- **Maintenance Free:** Unlike normal Granite, your composite sink is non-porous, so it will not need to be sealed. Cleaning is made easy with most stains being easily removed with just mild dish soap and a soft cloth.
